

|             |                                     |        |           |                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------|--------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | the trajectory                      |        |           | 1: Original point position in spatial coordinates                                                                                                                                                                                                                                         |
| sPathName   | Track name                          | string | -         | The name of the track, consisting of an underscore, letters or numbers, up to 29 characters.                                                                                                                                                                                              |
| dSpeedRatio | Trajectory motion velocity ratio    | double | 0.01~1.00 | Trajectory motion velocity ratio. This parameter is required for the calculation of PathJ.                                                                                                                                                                                                |
| dRadius     | transition radius                   | double | >0        | Transition radius in [mm]. This parameter is required for the calculation of PathJ.                                                                                                                                                                                                       |
| dVelocity   | trajectory speed                    | double | -         | The speed of the trajectory movement in [mm/s]. This parameter is needed when calculating PathL. When nRawDataType is 1, this parameter must be given; when nRawDataType is 0, this parameter is not needed, the system automatically uses the maximum value to calculate PathL.          |
| dAc<br>c    | trajectory acceleration             | double | -         | Trajectory motion acceleration in [mm/s <sup>2</sup> ]. This parameter is needed when calculating PathL. When nRawDataType is 1, this parameter must be given; when nRawDataType is 0, this parameter is not needed, the system automatically uses the maximum value to calculate PathL.  |
| dJerk       | Trajectory motion plus acceleration | double | -         | Trajectory motion plus acceleration in [mm/s <sup>3</sup> ]. This parameter is needed to calculate PathL. When nRawDataType is 1, this parameter must be given; when nRawDataType is 0, this parameter is not needed, the system automatically uses the maximum value to calculate PathL. |
